

Rabies Post Exposure Prophylaxis Prescription Addendum

Below is an example of a prescription that may be written for a patient based on the number of vaccines that have already been administered. Please note the days are the number of days after the first vaccine (Day 0) is administered. If the patient is immunocomprised an additional dose should be administered on Day 28 (for a total of 5 doses).

1. If the patient has already been administered RIG (Rabies Immunoglobulin) and the first rabies vaccine (Day 0) then:

Administer remainder of human rabies vaccine series on Days 3, 7, and 14.
